Choose a run and a setting
(limit, product, *cv*)
Generate 4000 trips:
warm spells, product
thermal response
Draw each trip's biology:
b, T_{min}, h_0, N_0
Grow bacteria along the
trace; label = limit passed
by the horizon?
Add sensor error and
sample every 1, 15 or 60 min
Compute scores: CSL,
simple rules, oracle,
probability
Evaluate: AUC, bootstrap,
Brier score, ECE
all settings
and runs done?
no
yes
Tables and figures
